Attention

The information contained in this document may change without notice. Therefore, please check our website (<u>www.kernelgroup.it</u>) regularly and always download the latest version available.

1 SAFETY

This product is a String Monitoring System (SMU) and its application is the monitoring of photovoltaic systems. From an electrical point of view, by their nature, photovoltaic systems operate in direct current and with very high voltage and current values.

Safety : General Conditions				
		- This product is therefore designed to operate with direct current voltage values up to 1500 VDC. This voltage value is potentially fatal. Voltage values between 24 VDC and 1500 VDC are therefore present on this product.		
	DANGER	- All transducers connected to the auxiliary input connectors must be isolated at 1500 VDC. These transducers are PT100 and, in the case of the ST2N and ST2 series, also transducers with 0/10 VDC and 0/20 mA output (typically anemometers)		

Safety : Installation and replacement precautions				
	DANGER	 The installation and / or replacement of this product must take place in absolute safety, therefore it is necessary to proceed with the installation and / or replacement of this product which is housed inside the field panel after disconnecting the power and dangerous voltages from solar panels. In any case, any intervention involving the handling of the SMU must be carried out by skilled and trained technicians equipped with insulation gloves 		
		designed for voltage values up to 1500 VDC and after disconnecting any voltage and current from the solar panels.		

Important Safety Instructions				
	DANGER	 Contact with wiring terminals inside the device can cause death by electric shock! Before to operate inside cards with tester, or with other measurement equipment, it is mandatory TO OPEN fuses and other components that can bring high level voltage inside cards. 		
	WARNING	 Please check all input and output wire terminals in case of high DC voltage and make sure there is no voltage before electrical connection to avoid electric shock! Do not touch the live parts of the input and output sides to avoid electric shock when checking or maintaining the device. All installation and wiring connections must be made by qualified technical personnel only. 		
À	CAUTION	 All wiring and operation must comply with the requirements of the relevant local standards of the device. Check the device and make sure there are no problems with the installation before putting it into operation! Connect the wires to the positive and negative marked positions of the device to avoid the risk of short circuit, ensure personal safety and keep the device in normal operation. 		
•	IMPORTANT	Reference to current standards For any other consideration, safety precaution, it is absolutely necessary, before carrying out any installation and / or replacement of the SMU, to refer to the regulations in force regarding the construction of combiner boxes.		

2 GENERAL NOTES

2.1 Introduction

The STOHS module to string control, allow to monitoring current and voltage generated by photovoltaic panels strings. When the current will be measured goes through a sensor, the voltage will be measured at the output end.

The STOHS board also provides two digital inputs and an on-board sensor which allow to measure the temperature. The digital inputs allows to detect the arrester state and the power disconnector switch state.

Is possible communicate with the STOHS board through a Fiber Optic connection. Using **Modbus RTU protocol**, or with **IEC 60870-5-101 protocol**, is possible monitoring all the physical quantities measured (temperature, currents, voltage). Moreover is possible keep monitored the fuses status on the string box, through the reading of an internal register on memory map (30034).

In the following image there are the "STOHS string controller" with all the wiring. Obviously isn't necessary connect all the specified devices, they are indicated to give a connection general idea.

3 HARDWARE CHARACTERISTICS

3.1 Hardware Characteristics

	ELECTRIC CHARACTI	ERISTICS		
Microprocessor	STM32F303			
Power supply		24 \	Vdc	
Power consumption (W)		< 2	W	
Maximum number of monitored strings		8	}	
Maximum common voltage	1500 \	v with precision	on better than (),5 %
Max. current for each string	25 A	45	A	60 A
Range of measurement	0 200 A	0 3	860 A	0 480 A
Current reading accuracy		Better th	nan 0,3 %	
Current reading precision	Better than 1,0 %			
Communication	Fiber Optic			
Digital Inputs	2 digital inputs 24 Vdc PNP		ts 24 Vdc PNP	
Analog inputs	1 input PT100 + 1 on board temperature sensor to know the temperature inside the string box panel			
Working temperature's range		From -40	to +85 °C	
Working atmosphere		Without co	rrosive gas	
ID Address	Defined by dip-switches			
Size (naked) 209 x 108 mm		08 mm		
Size (with support for din rail bar)	213 x 128 mm			
Working humidity	Lower 95 % without condensation		n	
MTBF	> 500000 hours			
Maximum Operating Altitude	4000 meters			
Minimum Current	1 A (programmab	ammable) from Firmware Version :		Firmware Version :
Minimum Voltage	100 V (programma	ble)		1.31 forward

N°	Type of resources	Symbol	Terminal Block
1	Sensor on board to read the temperature (precision better than 1,5 $\%$)	T2	On board
1	Fiber Optic connection : is used to connect many "STOHS string controllers" into a network or to a PC. Is possible select the communication characteristics with some dip-switches on board (node address, baud rate, parity, and communication protocol, that may be Modbus RTU or IEC 60870-5-101). It's divided in 2 connectors (Single Ring) or 4 connectors (Double Ring)	FIBER OPTIC	CN2
1	PT100 input (from -20 to +120 $^\circ\text{C})$ to temperature reading, with precision better than 1,5 $\%$	T1	CN4
2	PNP digital inputs 24 Vdc, typically used to arrester connection, switches or other devices	INPO, INP1	CN4
8	This board can manage the current reading of 8 strings until 25 / 45 / 60 A with typical precision of 1.0 % and a temperature between -20 and +80 $^\circ\text{C}$	Ch1Ch8	Hall Sensors

3.2 Board Dimensions

3.3 Connectors

3.4 Connector : CN1

POWE	R SU 24 Vdc	JPPLY
+	NC	-
	٥	•
1	2	3

3.5 Connector : CN3

To read the voltages, is necessary connect the negative cable to pin "-" and the positive cable to the pin "+" of connector CN3. You'll find the voltage value on **30040** (instant value) or **30084** (average value on last 6 seconds).

3.6 Connector : CN4

To know when a switch (for example the general one) is ON or OFF, there are two digital inputs PNP 24 Vdc on terminal block CN4. Each digital input status is indicated also by a led status on board. You need to use the pins 5, 6, 7 and 8. Inside the memory map the bits from 0 to 1 of register 30001 are the digital input status.

Is possible connect one PT100 to read the external temperature. The PT100 could be 2 or 3 wires, it will be connected as shown in the figure above to terminal block CN4. You can find this temperature on register 30044.

3.7 Memory Protection

Memory is always protected by writing! In order to enable writing for a limited time (10 minutes), you have to write :

Value: 0x5555 Hex Modbus Register: 40100

3.8 Dip-switches

Note : Parity = NO_PARITY ; Bit = 8 ; Stop = 1

Some dip-switches examples :

3.9 Fixing system of the naked board (without supporting box)

To fix the naked board (without case) is necessary use plastic spacers with dual clutch. The plastic spacers must be 4x20 mm or 4x25 mm (4 mm is the hole diameter on the board). Look the below picture.

3.10 Status led

On the board there is a status led which with its blinking show the board status.

There are two possible different blinking ways : blinking each 0,5 sec, or blinking faster. If the blinking is 0,5 sec ON and 0,5 sec OFF, it means that the board is ready to communicate with an external device, instead if the blinking is faster than 0,5 sec, it means that the board is in test mode with all the dip-switch OFF. In this way the board isn't ready to communicate with an external device.

3.11 Positive Current Values

IMPORTANT

To have **POSITIVE CURRENT VALUES**, you must insert the cables into the Hall sensors in one of the following ways :

IF YOU USE THE "+" [POSITIVE] CABLE Insert the cable from the BOTTOM to the TOP :

IF YOU USE THE "-" [NEGATIVE] CABLE Insert the cable from the TOP to the BOTTOM :

IMPORTANT

3.12 Informations about wires and connectors

CURRENT SENSOR			
Max Wire Section	10 mm²		
Operating temperature	-40°C ÷ +105°C		

OTHER CONNECTORS (Power Supply)			
Wire Range	2.5 mm ² / 0.34-2.5 mm ²		
Wire Strip length	7 - 8 mm		
Solid Wire (AWG)	12-24 / 14-22		
Screw	M3		
Max Torque	0.56 Nm [5.0 Lbf-In]		
Operating temperature	-40°C ÷ +115°C		

VOLTAGE CONNECTOR			
Wire Section	2.5 mm ² / 0.20-2.5 mm ²		
Stripping length	7 mm		
Conductor cross section AWG/kcmil	24 to 12		
Screw	M3		
Min / Max Torque	0.50 Nm / 0.60 Nm [4.4 Lbf-In / 5.3 Lbf-In]		
Operating temperature	-40°C ÷ (depends on the derating curve)		

3.13 Connection Types

Is possible connect STOHS with 3 different configurations as below! The 3 types are the following :

- 1. "Single Ring or Single Connection"
- 2. "Double Ring or Double Connection" [Redundant]
- 3. "Multidrop Connection" [Redundant]

The final result is as schematized here below :

SINGLE RING / SINGLE CONNECTION

FB 2485H

Protocol = MODBUS or IEC 60870-5-101

DOUBLE RING / DOUBLE CONNECTION [REDUNDANT]

Protocol = MODBUS or IEC 60870-5-101

Kernel Sistemi s.r.l.

MULTIDROP CONNECTION [REDUNDANT]

Protocol = MODBUS or IEC 60870-5-101

3.14 Reading speed

The analogic values of the currents, the voltage and the temperature are read simultaneously 10 times per second (100 msec scan time), then are inserted in it's own FIFO (a FIFO for each analogic value), 16 values deep. The value read from the board is the mobile mean of the FIFO, so it is the mean of the last 16 read values (1.6 sec), updated every 100 msec. This is done to make the analogic readout more stable and it is a good compromise between speed and readout stability.

The instant values of the analogic are temporary stored into a hidden memory area, not accessible to the COM port.

The update time depend on the speed polling time of the SCADA and the communication baud rate.

The total time requested to read the board via com port is splitted into three times: the query time, the latency time and the response time.

The query time is the time needed by the SCADA to send the MODBUS query packet and depends on the baud rate (about 4 msec at 19200 baud rate).

The latency time is the time need by the board to process the query and prepare the answer, it is between 1 and 2 msec and it is independent on the baud rate.

The response time is the time needed byte the board to send the MODBUS answer packet, it's depend on the baud rate and on the number of registers read at a time, for a single register read at 19200 baud it is about 4 msec.

So at 19200 baud rate the total time needed to read a single register is about 10 msec., you have to add 1 msec every other register read, for example to read 16 registers with a single query will take 10 msec + 15 * 1 msec = 25 msec.

3.15 Scada - PLC

Typically the PLC communicates via Modbus TCP / IP protocol with the SCADA in the control room with Ethernet or fiber optic or wireless connection.

4 MEMORY MAP

The STOHS has the following memory map, it's made of 16 bits locations (1 word) called "REGISTERS". Because each REGISTER is composed by 16 bits, its maximum value will be 65535.

Max. current for each string		25 A	45 A	60 A

NOTES

Each "Offset Register" has 0 as default value. Each "Gain Register" has 1000 as default value. The value 1000 means x1, in this way, for example, is possible write 500 and make the value x0,5.

4.1 Memory Map Description

30001 : the first two bits of these register are the mirror status of the two digital inputs on the board (INPO, INP1 on CN4). So if 30001 = 000000000000011 [bin] = 3 [dec], it means that all the two digital inputs are ON.

30002 ... 30009 : these registers contains the current value of the current reading on each channel. It is in mA

30034 : the first eight bits of 30034 show if each channel current reading is under 200 mA or not. This threshold represent the fuse status.

30040 ... **30049** : these registers show the value of some readings as the temperatures (T1 and T2), voltage reading (on connector CN3) etc...

30052 ... **30059** : these registers contains the average value on last 6 seconds of the current reading. Obviously these values are more stable than the instantaneous values show in registers 30002 ... 30009

40001 : through this register is possible set the communication parity. The default value is zero, so "no parity"

40002 ... **40009** : these are the offset registers. These registers (whose default value is 0) allow to add a constant value to the current reading. This allow to adjust a possible reading error. For example if 30002 show 2300 (it means that channel CH1 read 2,3A), writing 40002 = 200 the new value of the reading will be 30002 = 2500 (it means that channel CH1 read 2,5A).

40052 ... **40059** : these are the gain registers. These registers (whose default value is 1000) allow to multiply a constant value to the current reading. This allow to adjust a possible reading error. For example if 30002 show 2300 (it means that channel CH1 read 2,3A), writing 40052 = 1500 the new value of the reading will be 30002 = 3450 (it means that channel CH1 read 3,45A, 2300 x 1,5 = 3450).

40101 ... **40108** : these are 8 registers available to the user. They can contain data useful to the customer, for example a different progressive number for each board.

40201 : Shunt Type (= 30204) - READ ONLY

40202 : SMU Model (= 30202) - READ ONLY

40203 : Firmware Version (= 30201) - READ ONLY

40204 : Channels Number (= 30203) - READ ONLY

40205 : End Scale (= 30205) - READ ONLY

40206 ... 40209 : Not Used - Reserved for Future Use (RFU)

40210 ... **40215** : **Unique device ID register (96 bits)** (organized in six 16 bit words) that is unique for any board. (= 30211 ... 30216) - READ ONLY

The unique device identifier is ideally suited :

• for use as serial numbers (for example string serial numbers or other end applications).

• for use as part of the security keys in order to increase the security.

The 96-bit unique device identifier provides a reference number which is unique for any device and in any context. These bits cannot be altered by the user. The code is composed of the following parts :

UID [31:00] : X and Y coordinates on the wafer expressed in BCD format UID [39:32] : WAF_NUM [07:00] > Wafer number (8-bit unsigned number) UID [63:40] : LOT_NUM [23:00] > Lot number (ASCII encoded) UID [95:64] : LOT_NUM [55:24] > Lot number (ASCII encoded)

5 OPTICAL FIBER

5.1 OFC Network features

The characteristics of the fiber optic network achievable with the KERNEL SMUs with OFC interface on board are the following :

Max number of SMU that it's possible to connect in one network	256
Maximum distance between	2 - 3 KM
2 consecutive SMUs	if the "fiber / connector" connections are correct
Recommended	Multimode OM2 class or higher
fiber optic features	50/125 μm or 62.5/125 μm
Connectors features	ST

IMPORTANT

The optical signal is regenerated internally to each SMU so that, each SMU retransmits the optical signal at the <u>maximum</u> <u>power</u>.

So the first SMU, connected to the FB2485H converter, receives the same level of optical signal that receives the last SMU of the network.

IMPORTANT

5.2 Optical Fiber Connector

Here are indicated the characteristics of the optical fiber connector on the board :

Kernel Sistemi s.r.l.

5.3 Optical Fiber Cable

The optical fiber cable which is necessary to the connection, must be a compatible cable :

Optical Fiber	Compatible with : 50/125 μm 62.5/125 μm 100/140 μm 200 μm Plastic-Clad Silica (PCS) Fiber
In Compliance with standard	OM1, OM2, OM3, OM4

6 ORDER CODES

Here below the order codes :

CODE	DESCRIPTION
STOHS 0825NC\SR	Device with support for din rail bar + 2 Fiber Optic Connectors
STOHS 0825NK\SR	Device without support for din rail bar + 2 Fiber Optic Connectors
STOHS 0825NC\DR	Device with support for din rail bar + 4 Fiber Optic Connectors
STOHS 0825NK\DR	Device without support for din rail bar + 4 Fiber Optic Connectors
STOHS 0845NC\SR	Device with support for din rail bar + 2 Fiber Optic Connectors
STOHS 0845NK\SR	Device without support for din rail bar + 2 Fiber Optic Connectors
STOHS 0845NC\DR	Device with support for din rail bar + 4 Fiber Optic Connectors
STOHS 0845NK\DR	Device without support for din rail bar + 4 Fiber Optic Connectors
STOHS 0860NC\SR	Device with support for din rail bar + 2 Fiber Optic Connectors
STOHS 0860NK\SR	Device without support for din rail bar + 2 Fiber Optic Connectors
STOHS 0860NC\DR	Device with support for din rail bar + 4 Fiber Optic Connectors
STOHS 0860NK\DR	Device without support for din rail bar + 4 Fiber Optic Connectors
