1 SAFETY

This product is a String Monitoring System (SMU) and its application is the monitoring of photovoltaic systems. From an electrical point of view, by their nature, photovoltaic systems operate in direct current and with very high voltage and current values.

Safety : General Conditions	
DANGER	- This product is therefore designed to operate with direct current voltage values up to 1500 VDC. This voltage value is potentially fatal. Voltage values between 24 VDC and 1500 VDC are therefore present on this product. - All transducers connected to the auxiliary input connectors must be isolated at 1500 VDC. These transducers are PT100 and, in the case of the ST2N and ST2 series, also transducers with 0/10 VDC and 0/20 mA output (typically anemometers)

Safety : Installation and replacement precautions	
DANGER	- The installation and / or replacement of this product must take place in absolute safety, therefore it is necessary to proceed with the installation and / or replacement of this product which is housed inside the field panel after disconnecting the power and dangerous voltages from solar panels. - In any case, any intervention involving the handling of the SMU must be carried out by skilled and trained technicians equipped with insulation gloves designed for voltage values up to 1500 VDC and after disconnecting any voltage and current from the solar panels.

Important Safety Instructions	
DANGER	- Contact with wiring terminals inside the device can cause death by electric shock! - Before to operate inside cards with tester, or with other measurement equipment, it is mandatory TO OPEN fuses and other components that can bring high level voltage inside cards.
WARNING	- Please check all input and output wire terminals in case of high DC voltage and make sure there is no voltage before electrical connection to avoid electric shock! - Do not touch the live parts of the input and output sides to avoid electric shock when checking or maintaining the device. - All installation and wiring connections must be made by qualified technical personnel only.
CAUTION	- All wiring and operation must comply with the requirements of the relevant local standards of the device. - Check the device and make sure there are no problems with the installation before putting it into operation! - Connect the wires to the positive and negative marked positions of the device to avoid the risk of short circuit, ensure personal safety and keep the device in normal operation.
IMPORTANT	**Reference to current standards** For any other consideration, safety precaution, it is absolutely necessary, before carrying out any installation and / or replacement of the SMU, to refer to the regulations in force regarding the construction of combiner boxes.

2 GENERAL NOTES

2.1 Introduction

The ST0N module to string control, allow to monitoring current and voltage generated by photovoltaic panels strings. For example is possible connect each other 32 PV panels at 36 V to each string channel, with positive pole connected each other. The negative pole of each string is brought to the dedicated input, like in the following picture :
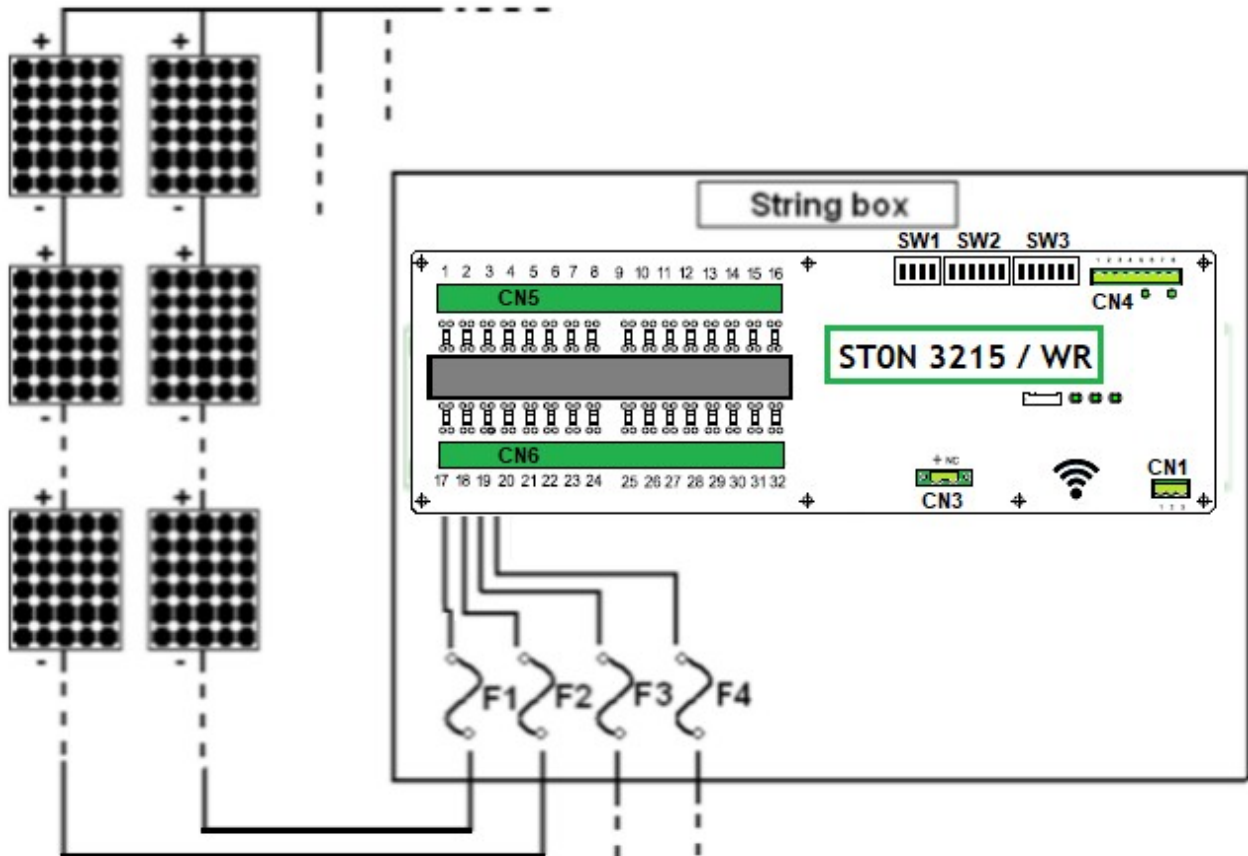

After the strings input connector, on the ST0N board there is a resistor, it is necessary to detect the current follow :
and finally a copper bar connect all the negative poles, thus creating a common 0 V.

The ST0N board also provides two digital inputs and an on-board sensor which allow to measure the temperature.
The digital inputs allows to detect the arrester state and the power disconnector switch state.
Is possible communicate with the ST0N board through a WIRELESS connection. Using **Modbus RTU protocol**, or with **IEC 60870-5-101 protocol**, is possible monitoring all the physical quantities measured (temperature, currents, voltage). Moreover is possible keep monitored the fuses status on the string box, through the reading of 2 internal registers on memory map (30034 and 30035).
In the following image there are the "ST0N string controller" with all the wiring. Obviously isn't necessary connect all the specified devices, they are indicated to give a connection general idea.

ST0N3215Nx WR
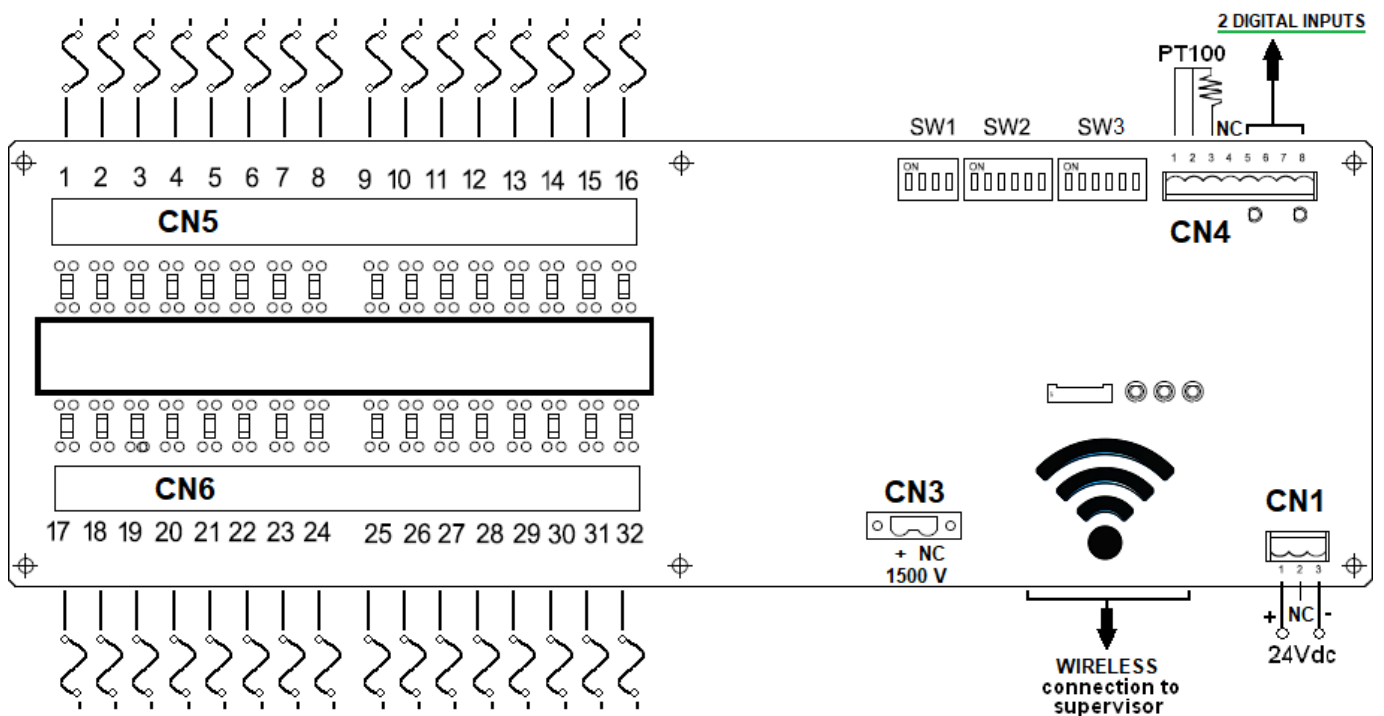

3 HARDWARE CHARACTERISTICS

3.1 Hardware Characteristics

ELECTRIC CHARACTERISTICS	
Microprocessor	STM32F303
Power supply	24 Vdc
Power consumption (W)	< 3 W
Maximum number of monitored strings	32
Maximum common voltage	1500 V with precision better than 0,5 %
Max. current for each string	15 A
Range of measurement	0 … 480 A
Current reading accuracy	Better than 0,15 %
Current reading precision	Typical 0,8 %
Communication	Wireless (**Modbus RTU** or **IEC 60870-5-101**)
Digital Inputs	2 digital inputs 24 Vdc PNP
Analog inputs	1 input PT100 + 1 on board temperature sensor to know the temperature inside the string box panel
Working temperature's range	From -40 to +85 ˚C
Working atmosphere	Without corrosive gas
ID Address	Defined by dip-switches
Size (naked)	338 x 108 mm
Size (with support for din rail bar)	342 x 108 mm
Working humidity	Lower 95 % without condensation
MTBF	> 500000 hours
Maximum Operating Altitude	5000 meters

Minimum Current	1 A (programmable)	from Firmware Version : **1.31** forward
Minimum Voltage	100 V (programmable)	

N°	Type of resources	Symbol	Terminal Block
1	Sensor on board to read the temperature (precision better than 1,5%).	**T2**	**On board**
1	WIRELESS Connection. This connection is used to connect many "ST0N string controllers" into a network or to a PC. Is possible select the communication characteristics with some dip-switches on board (node address, baud rate, parity, and communication protocol, that may be **Modbus RTU** or **IEC 60870-5-101**).	**WIRELESS**	**CN2**
1	PT100 input (from -20 to +120 ˚C) to temperature reading, with precision better than 1,5 %	**T1**	**CN4**
2	PNP digital inputs 24 Vdc, typically used to arrester connection, switches or other devices.	**INP0, INP1**	**CN4**
32	This board can manage the current reading of 32 strings until 15 A with typical precision of 0,8 %. and a temperature between -40 and +85 ˚C	**Ch1 … Ch32**	**CN5, CN6**

3.2 Power Dissipation

First of all we have to distinguish from "**power dissipation**" to "**power consumption**" : power dissipation is the total amount of power dissipated by the SMU, that is splitted in two parts : the part needed to supply the electronics and the part dissipated by the shunts used to measure the string currents. Only the part needed by the electronic (the power consumption) is to be supplied by the external 24 V power supply, this part is fixed and is typically less then **3 W** (125 mA) for all models of SMU.

The part dissipated by the shunt is variable and depends by the number of shunts and by the current that flows into them. To calculate the dissipation of each channel you can use the following formula, valid for all the SMU model :

Shunt_Power = current * current * 0.001 (where 0.001 is the ohmic resistance of the shunt)
than you have to multiply for the number of channels (shunts)

- **Example ST0N3215 : if you consider a current of 15 A you have :**
  15 * 15 * 0.001 * 32 = 7.2 W

- **Example ST0N3215 : if you consider a current of 7.5 A you have :**
  7.5 * 7.5 * 0.001 * 32 = 1.8 W

This part of power is not to be supplied by the 24 V external power supply because it is directly generated by the current from PV strings.

IMPORTANT

It is possible to power the board directly from PV panels using an insulated DC/DC power supply for PV usage. Of course keep in mind that before the sunrise and after the sunset the voltage from the PV is zero, so the DC/DC converter does not work and the board is not powered.

3.3 Connector : CN1

POWER SUPPLY
24 Vdc

+　　**NC**　　**−**

1　　2　　3
3.4 Connector : CN3

To read the voltages, is necessary connect the negative of the panel's string to one channel and the positive to the positive pin of connector CN3. You'll find the voltage value on 30040.

+　**NC**

1　　2

VOLTAGE (0...1500V)

CN3
3.5 Connector : CN4

To know when a switch (for example the general one) is ON or OFF, there are two digital inputs PNP 24 Vdc on terminal block CN4. Each digital input status is indicated also by a led status on board. You need to use the pins 5, 6, 7 and 8. Inside the memory map the bits from 0 to 1 of register 30001 are the digital input status.

Is possible connect one PT100 to read the external temperature. The PT100 could be 2 or 3 wires, it will be connected in the following way to terminal block CN4. You can find this temperature on register 30044**.**

0 Vdc　+24 Vdc　0 Vdc　+24 Vdc

PT100

- 0 Vdc　+ INP0　- 0 Vdc　+ INP1

NC

1　2　3　4　5　6　7　8

DIGITAL INPUTS
3.6 Fixing system of the naked board (without supporting box)

To fix the naked board (without case) is necessary use plastic spacers with dual clutch.
The plastic spacers must be 4x20 mm or 4x25 mm (4 mm is the hole diameter on the board).
Look the below picture.

3.7 Status led

On the board there are 3 status led which with their blinking show the board status :
1. **LD 1 = STATUS :** it blinks each second, it means that the board is ready to communicate
2. **LD 2 = RX** : It turns ON when the SMU receives a valid and recognized command from the E_108 module
3. **LD 3 = TX** : It turns ON when the SMU responds to a valid command just received from the E_108 module

IMPORTANT
At startup the 3 leds flash rapidly in sequence 3 times.
After that LD 2 and LD 3 HAVE TO BLINK 3 times for 1 sec ON and 1 sec OFF to signal successful connection with module E_108.

3.8 Board Dimensions

Size (naked)	338 x 108 mm
Size (with support for din rail bar)	342 x 108 mm

3.9 Memory Protection

Memory is always protected by writing! In order to enable writing for a limited time (10 minutes), you have to write :

Value : 0x5555 Hex
Modbus Register : 40100

3.10 Connection Type : ST0N 3215Nx WRAD

The connection type is schematized here below :
Protocol = Modbus RTU or IEC 60870-5-101

STON 3215Nx WR : Data Sheet　　　　　　　　　　　　　　　9

3.11 Busbar

Examples of busbar connection :
If it is necessary to "**extend**" the busbar, the following fundamental rules must be followed :

1. The added bar must take the whole bar and be connected to all the bolts (with the correct tightening torque).

2. It must not have curves or irregularities.

3. It must be absolutely flat so as to be perfectly in contact on the whole surface of the bar.
This connection busbar **MUST** be perfectly planar.
It is therefore necessary to check that these busbars are perfectly planar **BEFORE** fixing them to the busbar of the board.

It is necessary FIRST to fix the "busbar connection to the Switch Disconnector" to the BOARD, then perform the fastening of this busbar to the Switch Disconnector. In doing so, the perfect contact between the "busbar connection to the S.D." and the busbar on the board is guaranteed.

<div style="background-color: yellow">

ATTENTION

The dimensions of the bar must be calculated according to the value of the **MAXIMUM CURRENT**
(follow the appropriate regulatory tables)
As an alternative to the bar, it is possible to connect more CABLES to the busbar on the board : also in this case the cables must be appropriately sized according to the value of the **MAXIMUM CURRENT**
(follow the appropriate regulatory tables).

</div>

Busbar dimensions : (n.1 BAR component side + n.1 BAR welding side)

TOLERANCE FOR ALL OF +/- 0.05mm

TIN BAR WITH 7 THREADED HOLES (FOR M6 SCREWS)

20

152.5

3.12 Dip-switches

Node Addressing

At the startup the SMU reads the node address from the DIP switch configuration [01..63] and assume that address. Moreover it configures the radio modem E_108 getting the configuration parameters from the DIP switches positions in this way :

- E_108 address = SMU address + 0x80

- E_108 group ID from the DIP 6 ... 11 (64 groups available)

- E_108 radio channel from the DIP 12 ... 15. There are **10** channels available :

```
From : CH 0 [ 0 0 0 0 ]
To   : CH 9 [ 1 0 0 1 ]
```

- E_108 coordinator = OFF
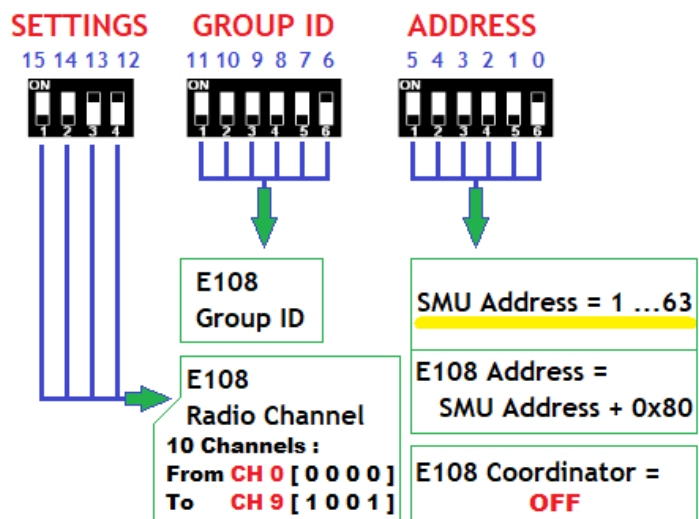

Radio Channel and Group ID

Talking as in electronics, these 2 parameters are like 2 multiplexers for the radio network deployment. First one (high priority) is Radio channel. All devices in the same network must have configured the same radio channel. So the radio channel parameters will be in charged of establish a radio network. There will be as much radio networks as different radio channels configured. On a lower priority, there is a possibility to, inside a radio network, make different sub-networks. This different sub-networks, will be defined by the group ID.

IMPORTANT

E108 module always is programmed to 19200 bauds. Don't change any UART parameters in E108.

3.13 Informations about wires and connectors

CHANNEL CONNECTOR	
Nominal Cross Section	6 mm²
Stripping length	8 mm
Conductor cross section AWG/kcmil	24 to 10
Screw	M3
Min / Max Torque	0.50 Nm / 0.60 Nm [4.4 Lbf-In / 5.3 Lbf-In]
Operating temperature	-40°C ÷ (depends on the derating curve)
VOLTAGE CONNECTOR	
Wire Section	2.5 mm² / 0.20-2.5 mm²
Stripping length	7 mm
Conductor cross section AWG/kcmil	24 to 12
Screw	M3
Min / Max Torque	0.50 Nm / 0.60 Nm [4.4 Lbf-In / 5.3 Lbf-In]
Operating temperature	-40°C ÷ (depends on the derating curve)
OTHER CONNECTORS (Power Supply, Serial ...)	
Wire Section	2.5 mm² / 0.34-2.5 mm²
Stripping length	7 - 8 mm
Solid Wire (AWG)	12-24 / 14-22
Screw	M3
Max Torque	0.56 Nm [5.0 Lbf-In]
Operating temperature	-40°C ÷ +115°C

Copper Bar	
Min / Max Torque	2.2 Nm / 2.5 Nm [19.5 Lbf-In / 22.1 Lbf-In]

4 MEMORY MAP

The ST0N has the following memory map, it's made of 16 bits locations (1 word) called "REGISTER". Because each REGISTER is composed by 16 bits, its maximum value will be 65535.

MODBUS Register	TYPE	DESCRIPTION
30001	RO	Inputs

NOTES

Each "Offset Register" has 0 as default value. Each "Gain Register" has 1000 as default value. *The value 1000 means x1*, in this way, for example, is possible write 500 and make the value **x0,5.**

4.1 Memory Map Description

30001 : the first two bits of these register are the mirror status of the two digital inputs on the board (INP0, INP1 on CN4). So if 30001 = 0000000000000011 [bin] = 3 [dec], it means that all the two digital inputs are ON.

30002 ... 30033 : these registers contains the current value of the current reading on each channel. It is in mA

30034, 30035 : the sixteen bits of 30034 and the sixteen bits of 30035 show if each channel current reading is under 200 mA or not. This threshold represent the fuse status.

30040 ... 30049 : these registers show the value of some readings as the temperatures (T1 and T2), voltage reading (on connector CN3) etc...

30052 ... 30083 : these registers contains the average value on last 6 seconds of the current reading. Obviously these values are more stable than the instantaneous values show in registers 30002 ... 30033

40001 : through this register is possible set the communication parity. The default value is zero, so "no parity"

40002 ... 40033 : these are the offset registers. These registers (whose default value is 0) allow to add a constant value to the current reading. This allow to adjust a possible reading error. For example if 30002 show 2300 (it means that channel CH1 read 2,3A), writing 40002 = 200 the new value of the reading will be 30002 = 2500 (it means that channel CH1 read 2,5A).

40052 ... 40083 : these are the gain registers. These registers (whose default value is 1000) allow to multiply a constant value to the current reading. This allow to adjust a possible reading error. For example if 30002 show 2300 (it means that channel CH1 read 2,3A), writing 40052 = 1500 the new value of the reading will be 30002 = 3450 (it means that channel CH1 read 3,45A, 2300 x 1,5 =3450).

40101 ... 40108 : these are 8 registers available to the user. They can contain data useful to the customer, for example a different progressive number for each board.

40201 : Shunt Type (= 30204) – READ ONLY

40202 : SMU Model (= 30202) – READ ONLY

40203 : Firmware Version (= 30201) – READ ONLY

40204 : Channels Number (= 30203) – READ ONLY

40205 : End Scale (= 30205) – READ ONLY

40206 ... 40209 : Not Used - Reserved for Future Use (RFU)

40210 ... 40215 : **Unique device ID register (96 bits)** (organized in six 16 bit words) that is unique for any board. (= 30211 **...** 30216) – READ ONLY

The unique device identifier is ideally suited :

• for use as serial numbers (for example string serial numbers or other end applications).

• for use as part of the security keys in order to increase the security.

The 96-bit unique device identifier provides a reference number which is unique for any device and in any context. These bits cannot be altered by the user. The code is composed of the following parts :

```
UID [31:00] : X and Y coordinates on the wafer expressed in BCD format
UID [39:32] : WAF_NUM [07:00] > Wafer number (8-bit unsigned number)
UID [63:40] : LOT_NUM [23:00] > Lot number (ASCII encoded)
UID [95:64] : LOT_NUM [55:24] > Lot number (ASCII encoded)
```

5 ORDER CODES

Here below the order codes :

CODE	WIRELESS	DESCRIPTION
ST0N 3215NC / WR	Wireless Option	Device with support for din rail bar
ST0N 3215NK / WR	Wireless Option	Device without support for din rail bar
ST0N 3215NC / WRAD	Wireless E-108	Device with support for din rail bar
ST0N 3215NK / WRAD	Wireless E-108	Device without support for din rail bar
ST0N 3215NC / WRLR01	Wireless Hoperf 868 MHz	Device with support for din rail bar
ST0N 3215NK / WRLR01	Wireless Hoperf 868 MHz	Device without support for din rail bar

6 CONTACTS

GENERAL
Tel: 059 469978 website: www.kernelgroup.it e-mail: info@kernelgroup.it

COMMERCIAL
Sig.ra Linda Mammi Tel: 059 469978 Int. 207 e-mail: sales@kernelgroup.it Skype: mammi.kernel

ADMINISTRATION
Sig.ra Paola Morandi Tel: 059 469978 Int. 201 e-mail: amministrazione@kernelgroup.it Skype: morandi.kernel

PURCHASING and PRODUCTION
Sig. Stefano Catuogno Tel: 059 469978 Int. 204 e-mail: produzione@kernelgroup.it Skype: catuogno.kernel

TECHNICAL OFFICE
Sig. Alessandro Muratori Tel: 059 469978 Int. 205 e-mail: alessandro.muratori@kernelgroup.it Skype: muratori.kernel
Support Tel: 059 469978 Int. 209 e-mail: support@kernelgroup.it Skype: support.kernel
